p. 476-477.

Investigation of a series of ternary systems
 $PbO - Fe_2O_3 - R_2O_3$, where R_2O_3 is a rare earth
oxide of Y_2O_3 , shows that, with heating to 1320° to
1330°C, complete and reciprocal dissolution of the
components occurs and that, during subsequent slow
temperature reduction, nucleation and crystal growth
of more complex composition than the starting com-
ponents are possible. Crystals of $Y_3Fe_5O_{12}$,
 $Sm_3Fe_5O_{12}$, $Gd_3Fe_4O_{12}$ and similar compounds of
other rare earth analogs were grown by the Nielsen
method (J. Appl. Phys. 29: 3, 390, 1958) from solli-
(Physics--Solid State, TT, v. 5, no. 12)

DESCRIPTORS: Water, Pumps, *Check valves,
Operation.

The data provided show that to make possible the start-
ing of a pump with the gate valve open, it is necessary
to examine the closure condition of the check valve and
to choose a design of check valve with this in mind, re-
sorting in unavoidable cases to the provision of a by-
pass line for the valve, as has been done at the Stalin
station of the Moscow waterworks.
